## 4 ways to SMTP Enumeration

posted in **PENETRATION TESTING** on **SEPTEMBER 25, 2017** by **RAJ CHANDEL**  **SHARE**

We can also find out **version** and **valid user** of SMTP server **using telnet**. Execute following command and find out its version and valid user.

### Telnet

**telnet 192.168.1.107 25**

From given image you can observe that it has successfully shown “220 mail.ignite.lab ESMTP Postfix” has been installed on target machine.

You can guess for valid user account through following command and if you receive response code 550 it means unknown user account:

Search

Subscribe to Blog via Email

**SUBSCRIBE**

vrfy [raj@mail.lab.ignite](mailto:raj@mail.lab.ignite)

If you received message **code 250,251,252** which means server has accept the request and user account is valid.

But if you received message **code 550** it means invalid user account as shown in given image

vrfy [admin@mail.ignite.lab](mailto:admin@mail.ignite.lab)

```
root@kali:~# telnet 192.168.1.107 25
Trying 192.168.1.107...
Connected to 192.168.1.107.
Escape character is '^]'.
220 #myhostname ESMTPE postfix (Ubuntu)
vrfy raj@mail.ignite.lab
252 2.0.0 raj@mail.ignite.lab
vrfy admin@mail.ignite.lab
550 5.1.1 <admin@mail.ignite.lab>: Recipient address rejected: User unknown in l
ocal recipient table
421 4.4.2 mail.ignite.lab Error: timeout exceeded
Connection closed by foreign host.
```

## Metasploit

The SMTP service has two internal commands that allow the enumeration of users: VRFY (confirming the names of valid users) and EXPN (which reveals the actual address of user's aliases and lists of e-mail (mailing lists)). Through the implementation of these SMTP commands can reveal a list of valid users.

use auxiliary/scanner/smtp/smtp\_enum

msf auxiliary(smtp\_enum) > set rhosts 192.168.1.107

msf auxiliary(smtp\_enum) > set rport 25

msf auxiliary(smtp\_enum) > set USER\_FILE /root/Desktop/user.txt

**msf auxiliary(smtp\_enum) > exploit**

From given image you can read the valid username found in targeted server as well as it also grab SMTP banner.

```
msf > use auxiliary/scanner/smtp/smtp_enum
msf auxiliary(smtp_enum) > set rhosts 192.168.1.107
rhosts => 192.168.1.107
msf auxiliary(smtp_enum) > set rport 25
rport => 25
msf auxiliary(smtp_enum) > set USER_FILE /root/Desktop/user.txt
USER_FILE => /root/Desktop/user.txt
msf auxiliary(smtp_enum) > exploit

[*] 192.168.1.107:25 - 192.168.1.107:25 Banner: 220 #myhostname ESMTP Postfix (Ubuntu)
[+] 192.168.1.107:25 - 192.168.1.107:25 Users found: aarti, raaz, raj, sr
[*] Scanned 1 of 1 hosts (100% complete)
[*] Auxiliary module execution completed
msf auxiliary(smtp_enum) > 
```

## smtp-user-enum

**smtp-user-enum** is a tool for enumerating OS-level user accounts on Solaris via the SMTP service (sendmail). Enumeration is performed by inspecting the responses to VRFY, EXPN and RCPT TO commands. It could be adapted to work against other vulnerable SMTP daemons, but this hasn't been done as of v1.0.

Type following command to enumerate username using dictionary of usernames:

**smtp-user-enum -M VRFY -U /root/Desktop/user.txt -t 192.168.1.107**

**-M:** mode Method to use for username guessing EXPN, VRFY or RCPT

**-U:** file File of usernames to check via smtp service

**-t:** host Server host running smtp service

From given image you can see out of total 7 queries only 5 names are valid and exist in smtp server.

```
root@kali:~# smtp-user-enum -M VRFY -U /root/Desktop/user.txt -t 192.168.1.107
Starting smtp-user-enum v1.2 ( http://pentestmonkey.net/tools/smtp-user-enum )

-----

Mode ..... VRFY
Worker Processes ..... 5
Usernames file ..... /root/Desktop/user.txt
Target count ..... 1
Username count ..... 7
Target TCP port ..... 25
Query timeout ..... 5 secs
Target domain .....

##### Scan started at Sun Sep 24 21:04:24 2017 #####
192.168.1.107: root exists
192.168.1.107: raj exists
192.168.1.107: sr exists
192.168.1.107: aarti exists
192.168.1.107: raaz exists
##### Scan completed at Sun Sep 24 21:04:24 2017 #####
5 results.

7 queries in 1 seconds (7.0 queries / sec)
```

Type following command to verify user email address on mail server:

```
smtp-user-enum -M VRFY -D mail.ignite.lab -u raj -t 192.168.1.107
```

**-D:** dom Domain to append to supplied user list to make email addresses; Use this option when you want to guess valid email addresses instead of just usernames.

From given image you can see it has shown `raj@mail.ignite.lab` is valid email ID for user raj.

# iSMTP

**iSMTP** is the kali Linux tool which is used for testing SMTP user enumeration (RCPT TO and VRFY), internal spoofing, and relay.

Type following command to enumerate valid email ID of targeted server:

```
ismtp -h 192.168.1.107:25 -e /root/Desktop/email.txt
```

**-h <host>** The target IP and port (IP:port)

**-e <file>** Enable SMTP user enumeration testing and imports email list.

From given image you can see blue color text refer to valid email account and red color text refer to invalid account.

```
root@kali:~# ismtp -h 192.168.1.107:25 -e /root/Desktop/email.txt
```

```

Hi there,

Command : "smtp-user-enum -M VRFY -p 25 -U /root/n.txt -t 10.11.1.22"

When i tried the below command, it shows zero results.

But when i tired using nectar or telnet, i am able to VRFY user.

Can you help or figure out why i am unable to get results using smtp-user-enum.
